

Payments Integration

Integrated & Cloud Hosted Solutions

The IntelliPay platform offers numerous Level 1 PCI DSS compliant integrated and cloud hosted payment solutions. All solutions can be used to process both Card and ACH processing and capable of supporting the following fee-based payment acceptance models:

Service Fees

Usage Fees

Surcharge Fees

Convenience Fees

Absorbed Fees

Integrated Payment Solution:

API Web Services Card Present Card Not Present

The Web API is a public interface which allows developers to manage customers and their payments online. Developers may connect to the web services using any programming language or environment they desire as long as they are familiar with SOAP, REST and XML Web Services and/or JSON. The API is completely platform and language neutral.

Cloud Hosted Payment Solutions:

Lightbox Terminal Card Not Present

The Lightbox Terminal is a PCI compliant solution that displays a hosted payment form that floats over your existing site. This makes it easy for customers to submit payments as they're able to view your sites in the background. The Lightbox also pulls customer ID numbers and payment amounts from the elements on your site, calculates and applies any payment fees then processes the transaction(s). Please refer to the developer documentation for sample PHP, Perl, CFML, Ruby, C#, VB.NET and Node.js code.

Online Payment Page Card Not Present

The Online Payment Page solution is a client branded, cardholder facing and cloud hosted solution used for processing secure, PCI compliant online ACH and Card payments. The page is accessed via a redirect link on your site.

Hosted Web Form Card Present Card Not Present

The Hosted Web Form supports numerous form customizations and provisions 20+ pre-load form and custom field values. The Form also supports read-only fields with post back data functionality.

Customer Payments Portal Card Not Present

The Customer Payments Portal solution is a fully hosted solution offering a three-step billing and payments process: 1) customer authentication; 2) billing presentment and 3) payment processing. Client billing files can be securely transmitted via web API or SFTP.

Key Platform Features & Functions

All of our payment solutions undergo rigorous annual "Level 1" PCI security reviews and adhere to all Payment Card Data Security Standards (DSS).

All of our cloud-based payment solutions are securely hosted in the Google Cloud which means a worry-free experience, exceptional uptime and an unlimited bandwidth via their managed instance group autoscaling capability.

The IntelliPay platform supports multiple User hierarchies. Masters and Administrators can fully manage downstream users and assign a multitude of processing and reporting rights, permissions and passwords.

The IntelliPay platform is highly configurable and includes customizable reporting & research options with multiple configuration settings such as Client Department drop-down menus and Client defined custom data fields.

We get it, data capture and multiple reporting options are critical to managing any Business. Tell us what data is important and we'll securely manage the data and provide detailed reporting and research options.

All of our solutions are capable of supporting multiple fee-based payment models and types, including Visa, Mastercard, Discover, American Express, ACH or eCheck payment processing.

Dedicated developer support is where we excel. We'll work closely with you to integrate, design, configure and deploy the right solution for your specific requirements and provide ongoing developer support.
